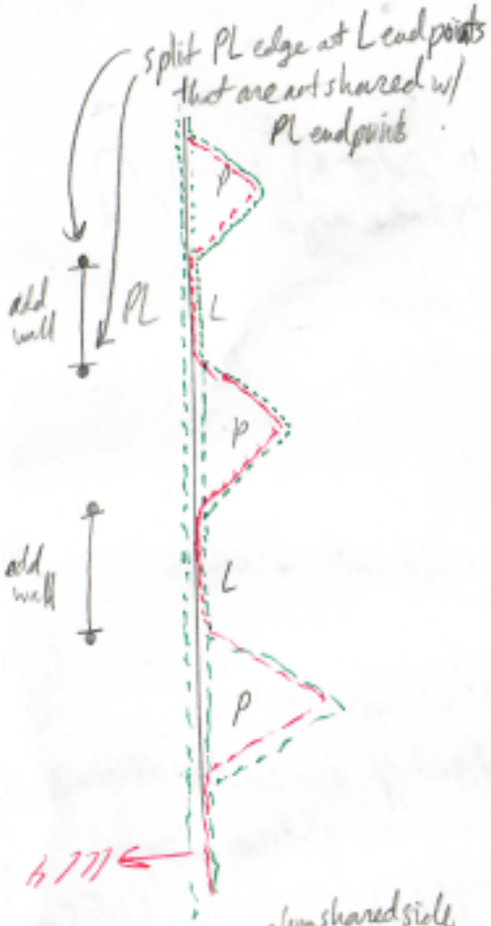
When creating a wall that lies upon the right or lower edge of a cell...

After creating walls, triangulate top and bottom



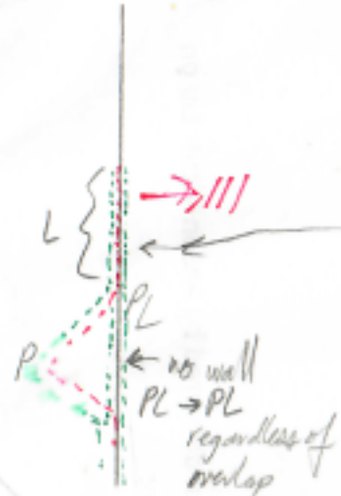
look through all L (along shared side) in neighbor cell for each PL in first cell on right or lower side
and for each L in first cell on right or lower side

PL → L wall = yes
PL ≥ L

PL → L wall = yes
exact match

L → PL where L exactly matches a L of a P
wall = yes

PL → L where L exactly matches a L of a P
wall = yes



L → PL
PL ≥ L
wall = yes

no wall
PL → PL
regardless of overlap

L → PL if PL ≥ L
PL → L if PL ≥ L

make wall with the shorter line L, split PL edge at L endpoints that are not shared with PL

PL → PL no wall
L → L no wall, should not happen!
